General Information About Fire Hose Packs and Bags

We now offer hose packs specifically designed for deployment of wildland Travis Packs. These packs are created specifically for packing and deployment of the Travis Pack (which can be known by other names across various regions). The Travis Pack was designed as a streamlined way to deploy hose on a wildland incident, replacing the old cumbersome Gazner-Barr Packs.

Until now, agencies were using the green GSA packs for these hose packs. However, there were always issues with these - specifically the size. The GSA packs were always a little small, which led not only to tight, sticky deployment of the packs, but also bloody knuckles when trying to pack the 1" hose.

Problem solved with AFT's new attack pack! These packs are not only specifically designed for hose pack deployment, but the cost is comparable to the old GSA packs!

Firefighter on the left has 1 Gazner-Barr Pack while the Firefighter on the right is carrying 2 AFT Packs

Contact us for instructions on packing the Travis Pack.

The Travis Pack Benefits:

- Lighter packs enable faster deployment
- Nozzle is always charged during deployment – No back-tracking is necessary to fight fire
- No strings that become loose or need for repacking
- Simple to pack and maintain, and can be re-packed in the field
- Pack is compact in size enabling more packs to be carried and stored
- All materials are available through the cache system
- Empty (deployed) pack can be used to retrieve appliances when removing hose lay
